Fast Food Storage System

A Java console project that models food items kept in storage, with a stack-based structure planned for managing them.

Project Structure

```
fastfoodstoragesystem/
|-- FoodItem.java                # Represents a single food item (implemented)
|-- FoodStack.java               # Stack to store FoodItem objects (in progress)
|-- Main.java                    # Program entry point (in progress)
`-- FastFoodStorageSystem.java   # NetBeans-generated main class (placeholder)
```

Classes

FoodItem

Represents one item in storage.

Field	Type	Description
name	String	Name of the food
weight	int	Weight in grams
bestBefore	LocalDate	Best-before date
timeAdded	LocalDateTime	Set automatically when the item is created

Methods: `getName()`, `getWeight()`, `getBestBefore()`, `getTimeAdded()` and `displayDetails()`, which prints all details to the console.

FoodStack

Intended to hold `FoodItem` objects using stack behaviour (push, pop, peek, display).

Main

Intended entry point for running and testing the system.

Requirements

- Java 8 or later (uses `java.time`)
- Apache NetBeans (the project was created in it)

How to Run

- Open the project in NetBeans, or compile from the command line:

```
javac fastfoodstoragesystem/*.java
java fastfoodstoragesystem.Main
```

- Note: `Main` needs a `public static void main(String[] args)` method before it can run.

Example Usage (once complete)

```
FoodItem burger = new FoodItem("Burger Patty", 150, LocalDate.of(2026, 11, 15));
burger.displayDetails();
```

Output:

```
Food: Burger Patty
Weight: 150 grams
Best-before date: 2026-11-15
Time added: 2026-10-30T10:43:00
```
